Hong Kong Well Life Biotechnology Limited
偉發（香港）生物科技有限公司

Introduction

"OzGen" is a Aquaculture Sterilization and Oxygenation Monitoring Machine invented by Alex Lam.

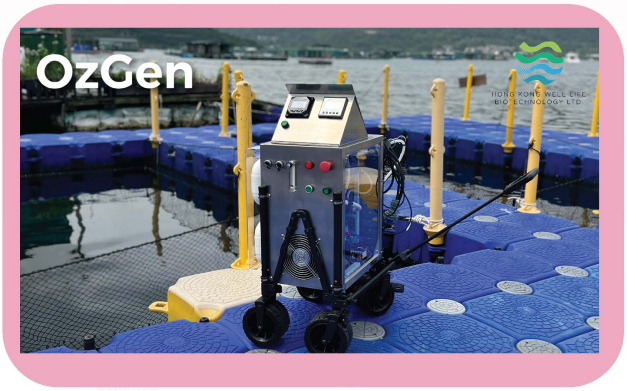

OzGen is specifically designed for high-density aquaculture to address the problems and environmental burdens associated with current high-density farming practices, aiming to enhance the sustainability of the aquaculture industry. By using OzGen throughout the farming cycle, it can improve water quality, increase dissolved oxygen levels, kill bacteria in the water, and enhance the fish environment under the same farming area and number of fish fry.

As a result, OzGen can improve fish survival rate, accelerate fish growth, increase fish harvest, and boost profits for fish farmers. OzGen is an all-weather 24/7 farming machine that has undergone five years of rigorous testing in Hong Kong's aquaculture farms. It has shown significant improvements in "survival rate," "incidence of fish diseases," "feed conversation rate" and the crucial factor of "farming density," making it highly encouraging. OzGen is a comprehensive solution that addresses the challenges of "oxygen deficiency," "red tide," and "parasites outbreak" commonly faced in high-density farming, effectively improving farming efficiency and production volume. Therefore, the research and promotion of OzGen hold great significance for the future and sustainable development of Hong Kong's aquaculture industry.

Vidi Labs Limited

Introduction

Seekr by Vidi Labs is a compact, discreet wearable tech helping visually-impaired people navigate spaces independently and safely through computer vision.

The Seekr device is a first-of-its-kind compact wearable ever to be designed for, and with the visually-impaired community. Deviating from medical and bulky looking form factors, the team packed the locally-run machine learning algorithm into a camera equipped clip-on device no bigger than a match box, which collects visual data and sends a curated audio feed of information to users through any Bluetooth-enabled earpiece.

The companion app makes our solution even more holistic, and works seamlessly with the accessibility features on smartphones. Established in 2021, it developed 4 iterations of working prototypes, customised our user experience design, and curated all training data according to the actual needs of VIPs. This is achieved by close partnerships with the three largest blind institutions covering a large percentage of the 200,000 VIPs in Hong Kong, and over 100 focus group interviews with VIPs. The team outruns many existing assistive tech in terms of user experience, community engagement, robustness of algorithm, and most important of all, VIP-oriented product and use case development.
